V.—*Note on the Malay Woodpecker. By Dr. WILLIAM BLAND, Surgeon of H. M. S. Wolf.*

In reference to Mr. HODGSON's description of three new species of Woodpecker, in your Journal of February last, and agreeing in his opinion most heartily, that *America* cannot shew specimens of woodpeckers superior, nor even equal to those which are produced in India, allow me to send you for his information and others interested in the ornithology of this country, the description and measurement of a woodpecker, shot at the extreme point of the Malay peninsula, in March last. A specimen, to which even the royal Nipalese bird must yield the palm,—and a beautiful and noble bird it is,—in size, strength, and beauty, was preserved and sent to *Scotland*; but the following description is from my note book.

Body, not including bill nor tail, nine inches long, tail eight inches; bill, very strong and hard; ridges, high and sharp, forming at the tip a complete wedge; breadth at the base 9-10ths of an inch; height 6-10ths, being 1-3rd more in breadth than depth.

Color, back, breast, neck, wings, upper and under coverts of the tail, and tail itself, glossy black; belly and under wing coverts yellow; head crowned with a scarlet erectile crest, and a patch of red feathers behind the under mandible, with a few white speckles on the throat; tail moderately wedged, consisting of ten strong feathers, worn at the tips, and covered with the juices from trees on which the bird feeds; a bare space round the eye; iris bright yellow; tongue four inches long; feet large, strong, and zygodactile, with considerable mobility of the outer toe; spread of wings two feet three inches; weight twelve ounces. His loud tapping on a tree heard at a considerable distance, led to his discovery, and I had named him "*Picus Maximus Malayensis*."
